

Problem A. Balanced Brackets

OS Linux

A bracket is considered to be any one of the following characters: `(`, `)`, `{`, `}`, `[`, or `]`.

Two brackets are considered to be a *matched pair* if the an opening bracket (i.e., `(`, `[`, or `{`) occurs to the left of a closing bracket (i.e., `)`, `]`, or `}`) of the *exact same type*. There are three types of matched pairs of brackets: `[]`, `{}`, and `()`.

A matching pair of brackets is *not balanced* if the set of brackets it encloses are not matched. For example, `{[()]}` is not balanced because the contents in between `{` and `}` are not balanced. The pair of square brackets encloses a single, unbalanced opening bracket, `(`, and the pair of parentheses encloses a single, unbalanced closing square bracket, `]`.

By this logic, we say a sequence of brackets is *balanced* if the following conditions are met:

- It contains no unmatched brackets.
- The subset of brackets enclosed within the confines of a matched pair of brackets is also a matched pair of brackets.

Given n strings of brackets, determine whether each sequence of brackets is balanced. If a string is balanced, return `YES`. Otherwise, return `NO`.

Function Description

Complete the function `isBalanced` in the editor below.

`isBalanced` has the following parameter(s):

- *string s*: a string of brackets

Returns

- *string*: either `YES` or `NO`

Input Format

The first line contains a single integer n , the number of strings.

Each of the next n lines contains a single string s , a sequence of brackets.

Constraints

- $1 \leq n \leq 10^3$
- $1 \leq |s| \leq 10^3$, where $|s|$ is the length of the sequence.

- All characters in the sequences $\in \{ \{, \}, (,), [,] \}$.

Output Format

For each string, return **YES** or **NO**.

Input		Output
STDIN	Function	YES
-----	-----	NO
3	n = 3	YES
{[()]}	first s = '[()]'	
{[()]}	second s = '[()]'	
{[[[()]]]}	third s = '{[[[()]]}'	

Explanation

- The string **{[()]}** meets both criteria for being a balanced string.
- The string **{[()]}** is not balanced because the brackets enclosed by the matched pair **{** and **}** are not balanced: **[()]**.
- The string **{[[[()]]]}** meets both criteria for being a balanced string.
